

NAPCO Nucleus — Team Onboarding

Five steps to stream Teams chat, attachments, and calls to the central agent

What this is

Your machine runs two tiny background jobs:

- A **15-minute scheduled task** that pushes your recent Teams chat (+ any attachments you've downloaded) to a shared folder on MVPACCESS.
- A **voice daemon** that records your Teams calls when it hears the start/stop phrases.

That's it. Mohammad triggers the heavy work (LLM identify + client email draft) from the agent host. You just keep these two running.

1. Prerequisites

- **Windows 10 or 11.** Teams chat ingest reads Teams' local IndexedDB cache, which is Windows-only.
- **MS Teams desktop**, signed in, with the client chats already opened at least once.
- **Git for Windows.**
- **Network access to the central share.** You should be able to open \\MVPACCESS\nucleus in File Explorer. If not, ping Mohammad for credentials.

2. Clone the repo

Open PowerShell or Git Bash and run:

```
git clone https://github.com/napco-labs/napco-nucleus.git
cd napco-nucleus
```

3. Double-click scripts\setup.bat

It will:

- Install Python 3.12 if missing (UAC prompt — click Yes).
- Create a virtualenv at .venv\ and install all dependencies.
- Open .env in Notepad.

In Notepad, fill in **at minimum** these four values, then save and close:

```
REQ_IMAP_USER=your.gmail@gmail.com
REQ_IMAP_PASSWORD=<16-char Gmail App Password — see note below>
NUCLEUS_CENTRAL_PATH=\\MVPACCESS\nucleus
NUCLEUS_DEV_NAME=Yourname # optional; defaults to Windows username
```

NAPCO Nucleus — Team Onboarding

Five steps to stream Teams chat, attachments, and calls to the central agent

Gmail App Password. Go to `myaccount.google.com/security` → confirm 2-Step Verification is ON → click **App passwords** → app: **Mail** → label: "NAPCO Nucleus" → copy the 16-character password. Your normal Google password will not work — Google blocks IMAP login with a regular password when 2FA is on.

You're done with this step when you see "Setup complete."

4. Register the 15-min chat-push

In an **admin PowerShell** (Start → "PowerShell" → right-click → Run as administrator), from inside the repo:

```
.\scripts\register-chat-push-task.ps1
```

Creates a "NAPCO Nucleus - Chat Push" entry in Task Scheduler that runs every 15 min, even when you're not logged in. To verify: Task Scheduler → Task Scheduler Library → look for the entry.

To remove later:

```
.\scripts\register-chat-push-task.ps1 -Unregister
```

5. Start the voice daemon

Double-click `scripts\start-daemon.bat`. Leave the terminal window running. To autostart on login, drop a shortcut to the `.bat` into `shell:startup` (Win+R → type that → drop the shortcut into the folder that opens).

6. Verify it's working

Fire one push immediately:

```
Start-ScheduledTask -TaskName 'NAPCO Nucleus - Chat Push'
```

Then look at `\\MVPACCESS\nucleus\<your name>\<today's date>\chat\` — you should see a `chat_<HHMM>-<HHMM>.docx` appear within ~30 seconds. If you don't, see Troubleshooting.

7. Day-to-day

What you want	What you do
Get your activity into the central pipeline	Nothing — the cron handles it every 15 min
Record a Teams call	Say "Assalamualaikum" / "Nucleus start" when the call begins; "Allah Hafez" / "Nucleus stop" when it ends. The daemon only records during real Teams calls.

NAPCO Nucleus — Team Onboarding

Five steps to stream Teams chat, attachments, and calls to the central agent

Include a file someone shared in Teams chat	Click Download on the chat attachment. Files in your ~/Downloads matching the chat's filename + size get auto-pushed on the next cron tick.
Pull updates after a git pull notice	Double-click scripts\update.bat
Run an ad-hoc local pull (your own session, not the team's)	Double-click scripts\pull-now.bat

7.1 Voice phrases

- **Start recording:** "Assalamualaikum" / "Salaam alaikum" / "Nucleus start"
- **Stop recording:** "Allah Hafez" / "Khoda Hafiz" / "Nucleus stop"

Recording only fires when MS Teams has an active call. Saying the phrase with Teams idle does nothing — by design. To edit phrases, open data\teams\voice_phrases.json and restart the daemon.

7.2 About chat attachments (important!)

The system pushes Teams chat files **only if you've downloaded them locally**. If a teammate shares requirements.pdf in chat and you never click "Download" on it, the file's content won't reach the LLM — only its filename and a URL will. **If a file matters for a client requirement, click Download.**

8. Troubleshooting

- **"Python not found"** after running setup.bat: open a brand-new PowerShell and re-run setup. The PATH change from winget needs a fresh shell.
- **Scheduled task ran but no file on central:** check the SMB share is reachable (Test-Path \\MVPACCESS\nucleus). If not, get an account on MVPACCESS from Mohammad.
- **Voice daemon prints "no Teams session in Active state"** when you say a phrase: that's the Teams-only gate working as designed. Pass --allow-any-call to disable: python -m teams.voice_daemon --allow-any-call.
- **Recording captured your voice but nothing else:** Teams → Settings → Devices → set Speaker = "Same as system / Default". Teams's separate Communications Device default makes the WASAPI loopback miss the other party.
- **"pip install failed"** in setup.bat: usually a corporate proxy issue. Run setup.bat again from inside your VPN.

For anything else, ping Mohammad.
