

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls to the central agent

OVERVIEW

What this is

Your machine runs two small background jobs:

- A **15-minute scheduled task** that pushes your recent Teams chat (and any attachments you've downloaded) to a shared folder on MVPACCESS.
- A **voice daemon** that records your Teams calls when it hears the start/stop phrases.

That's it. Titu triggers the heavy work — LLM identify and the client email draft — from the agent host. You just keep these two running.

STEP 1

Prerequisites

- **Windows 10 or 11.** Teams chat ingest reads Teams' local IndexedDB cache, which is Windows-only.
- **MS Teams desktop**, signed in, with the client chats already opened at least once.
- **Git for Windows.**
- **Network access to the central share.** You should be able to open \\172.16.205.209\nucleus-central in File Explorer. If not, ping Titu for credentials.

STEP 2

Clone the repo

Open PowerShell or Git Bash and run:

```
git clone https://github.com/napco-labs/napco-nucleus.git
cd napco-nucleus
```

STEP 3

Double-click scripts\setup.bat

It will:

- Install Python 3.12 if missing (UAC prompt — click **Yes**).
- Create a virtualenv at .venv\ and install all dependencies.
- Open .env in Notepad — pre-filled, **no secrets needed**.

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls to the central agent

No Gmail App Password, no API key, nothing private. The agent host (MVPACCESS) owns every credential — pulling email, posting drafts, hitting the LLM all happen there. Your machine only writes Teams chat and calls into a network folder using your normal Windows login.

In Notepad, just confirm NUCLEUS_CENTRAL_PATH matches the team's share (ships pre-set to \\172.16.205.209\nucleus-central). Optionally set NUCLEUS_DEV_NAME to a friendlier label than your Windows username. Save and close.

You're done with this step when you see "Setup complete."

STEP 4

Register the 15-min chat-push

In an **admin PowerShell** (Start → "PowerShell" → right-click → *Run as administrator*), from inside the repo:

```
.\scripts\register-chat-push-task.ps1
```

Creates a "NAPCO Nucleus - Chat Push" entry in Task Scheduler that runs every 15 min, even when you're not logged in. To verify: *Task Scheduler* → *Task Scheduler Library* — look for the entry.

To remove later:

```
.\scripts\register-chat-push-task.ps1 -Unregister
```

STEP 5

Start the voice daemon

Double-click `scripts\start-daemon.bat`. Leave the terminal window running.

To autostart on login, drop a shortcut to the `.bat` into `shell:startup` (Win+R → type that → drop the shortcut into the folder that opens).

VERIFY

Confirm it's working

Fire one push immediately:

```
Start-ScheduledTask -TaskName 'NAPCO Nucleus - Chat Push'
```

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls to the central agent

Then look at `\\172.16.205.209\nucleus-central\<your name>\<today's date>\chat\` — you should see a `chat_<HHMM>-<HHMM>.docx` appear within ~30 seconds. If you don't, see [Troubleshooting](#).

DAY-TO-DAY

What you do, what NN does

What you want	What you do
Get your activity into the central pipeline	Nothing — the cron handles it every 15 min.
Record a Teams call	Say “Assalamualaikum” or “Nucleus start” when the call begins; “Allah Hafez” or “Nucleus stop” when it ends. The daemon only records during real Teams calls.
Include a file someone shared in Teams chat	Click Download on the chat attachment. Files in your <code>~/Downloads</code> matching the chat's filename + size get auto-pushed on the next cron tick.
Pull updates after a <code>git pull</code> notice	Double-click <code>scripts\update.bat</code>
Run an ad-hoc local pull (your own session, not the team's)	Double-click <code>scripts\pull-now.bat</code>

Voice phrases

- **Start recording:** “Assalamualaikum” / “Salaam alaikum” / “Nucleus start”
- **Stop recording:** “Allah Hafez” / “Khoda Hafiz” / “Nucleus stop”

Recording only fires when MS Teams has an active call. Saying the phrase with Teams idle does nothing — by design. To edit phrases, open `data\teams\voice_phrases.json` and restart the daemon.

About chat attachments

The system pushes Teams chat files **only if you've downloaded them locally**. If a teammate shares `requirements.pdf` in chat and you never click “Download” on it, the file's content won't reach the LLM — only its filename and a URL will. **If a file matters for a client requirement, click Download.**

Five steps to stream Teams chat, attachments, and calls to the central agent

HELP

Troubleshooting

- **“Python not found”** after running setup.bat — open a brand-new PowerShell window and re-run setup. The PATH change from winget needs a fresh shell.
- **Scheduled task ran but no file on central** — check the SMB share is reachable: `Test-Path \\172.16.205.209\nucleus-central`. If it returns False, get an account on MVPACCESS from Titu.
- **Voice daemon prints “no Teams session in Active state”** when you say a phrase — that's the Teams-only gate working as designed. Pass `--allow-any-call` to disable: `python -m teams.voice_daemon --allow-any-call`.
- **Recording captured your voice but nothing else** — *Teams* → *Settings* → *Devices*, set Speaker to “Same as system / Default”. Teams's separate Communications Device default makes the WASAPI loopback miss the other party.
- **“pip install failed”** in setup.bat — usually a corporate proxy issue. Run setup.bat again from inside your VPN.

For anything else, ping Titu.
