

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

OVERVIEW

What this is

Your machine runs two small background jobs:

- **Three Scheduled Tasks** that push your recent Teams chat (and any attachments you've downloaded) to the central share on MVPACCESS at different cadences across the day — see the schedule in Step 4.
- **A voice daemon** that records your Teams calls when it hears a start/stop phrase. Now **24x7** (no BD-time-window gate).

That's it. Zaman triggers the heavy work — transcription, LLM identify, and the client email draft — on MVPACCESS. You just keep these two running on your laptop.

No secrets on your machine. No Gmail App Password, IMAP credentials, Claude API key, or Groq key. Every secret lives on MVPACCESS. Your laptop only needs network access to the central SMB share, which uses your normal Windows login.

STEP 1

Prerequisites

- **Windows 10 or 11.** Teams chat ingest reads Teams' local IndexedDB cache — Windows-only.
- **MS Teams desktop**, signed in, with every client chat opened at least once (so Teams populates its local cache).
- **Git for Windows.**
- **SMB access** to \\172.16.205.209\nucleus-central. Open File Explorer, paste that path, hit Enter. If it opens, you're good.
- **Admin rights on your laptop**, just for Step 4 (Scheduled Task registration).

STEP 2

Clone the repo

Open PowerShell or Git Bash and run:

```
git clone https://github.com/napco-labs/napco-nucleus.git
cd napco-nucleus
```

You can clone **anywhere** — C:\napco-nucleus, D:\Dev\NAPCO-Nucleus, %USERPROFILE%\source\repos\napco-nucleus, whatever. Scripts resolve paths relative to

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

themselves; the location doesn't matter.

Avoid paths with spaces (e.g. `C:\My Projects\`). The `.bat` scripts mostly handle them but some edge cases bite. Pick a path without spaces and save yourself time.

STEP 3

Run `scripts\setup.bat`

Either of these works:

```
scripts\setup.bat
```

Or double-click `setup.bat` in File Explorer. It will:

- Install Python 3.12 if missing (UAC prompt — click **Yes**).
- Create `.venv\` and install all dependencies (~2 min).
- Open `.env` in Notepad for you to confirm one line.

If you see “Python not found” right after, **open a brand-new PowerShell** and re-run `setup.bat`. `PATH` changes from a fresh Python install need a new shell.

In Notepad, the only line that matters is

`NUCLEUS_CENTRAL_PATH=\\172.16.205.209\nucleus-central`. It's pre-filled. Optionally set `NUCLEUS_DEV_NAME` to a friendlier label than your Windows username. Save and close — you'll see “Setup complete.”

STEP 4

Register the chat-push Scheduled Tasks (admin)

This is the most common place to trip. Three rules:

- **Use Administrator PowerShell**, not regular PowerShell, not `cmd`. Press **Win+X** → **Terminal (Admin)** → click **Yes** on UAC.
- **Don't double-click .ps1 files** — they open in Notepad by default. Run them through PowerShell instead.
- **You may need an execution-policy bypass** for the current session.

From admin PowerShell, `cd` into wherever you cloned the repo. **Always wrap the path in double quotes** — the same command works whether your path has spaces or not:

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

```
cd "E:\Projects\NAPCO-Nucleus"  
Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass  
.\scripts\register-chat-push-task.ps1
```

Replace the path with wherever you actually cloned the repo — e.g. `cd "C:\napco-nucleus"`, `cd "D:\Dev\NAPCO-Nucleus"`.

You should see **three** “Registered: ...” lines — Day, Transition, Evening — plus a coverage summary. The script unregisters any old 'NAPCO Nucleus - Chat Push' task automatically.

Chat-push schedule

Task	BD time	Cadence	Lookback
... (Day)	10:00, 12:00, 14:00, 16:00	every 2 hr	last 120 min
... (Transition)	17:30	once daily	last 90 min
... (Evening)	18:00, 18:30, ..., 24:00	every 30 min	last 30 min

Higher cadence in the evening — that's peak US-client interaction time.

To remove later:

```
.\scripts\register-chat-push-task.ps1 -Unregister
```

STEP 5

Install the voice daemon (autostart)

Double-click `scripts\install-voice-daemon.bat`. It registers **NAPCO Nucleus - Voice Daemon** as a Windows Scheduled Task that fires on every logon, restarts on crash, and starts the daemon immediately so you don't have to log out and back in. A console window appears with the daemon's logs — you can minimize it.

The daemon listens for start/stop phrases (case-insensitive) and only fires the recorder when MS Teams is actually in a call. Now **24×7** — no BD-time-window gate.

To remove later:

```
scripts\uninstall-voice-daemon.bat
```

VERIFY

Three quick checks

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

1. All three Scheduled Tasks registered and Ready?

```
Get-ScheduledTask -TaskName 'NAPCO Nucleus*' |  
Select-Object TaskName, State
```

Expected: three rows — (Day), (Transition), (Evening), all Ready. No plain NAPCO Nucleus - Chat Push, no (Backfill).

2. Voice daemon running?

```
Get-Process python -ErrorAction SilentlyContinue
```

Expected: at least one python.exe process.

3. Fire one chat-push immediately and check central:

```
Start-ScheduledTask -TaskName 'NAPCO Nucleus - Chat Push (Evening)'  
Start-Sleep 30  
Get-ChildItem "\\172.16.205.209\nucleus-central\$env:USERNAME\$(Get-Date -Format  
yyyy-MM-dd)\chat\"
```

Expected: a chat_<HHMM>-<HHMM>.docx file with a recent *LastWriteTime*.

GOTCHAS

Common install issues

Symptom	Fix
Double-clicked a .ps1 and it opened in Notepad	Right-click → “Run with PowerShell”, or invoke explicitly: powershell.exe -NoProfile -ExecutionPolicy Bypass -File scripts\register-chat-push-task.ps1
“running scripts is disabled on this system”	Run once before the script: Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass
“Access is denied” on Unregister-ScheduledTask	Not in admin PowerShell. Reopen as Administrator and retry.
HRESULT 0x800700b7 (ERROR_ALREADY_EXISTS) on Register-ScheduledTask	Orphan task XML on disk. The script's cleanup falls back to schtasks /delete automatically — just re-run the script and it heals itself.

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

Symptom	Fix
Setup.bat says “Python not found” right after install	Open a brand-new PowerShell and re-run the script. PATH change needs a fresh shell.
<code>pip install</code> fails	Corporate proxy / VPN issue. Re-run from inside your company VPN.
Path with spaces in clone location	Some .bat scripts handle them poorly. Re-clone to a space-free path (e.g. <code>C:\napco-nucleus</code>).

DAY-TO-DAY

What you do, what NN does

What you want	What you do
Get today's Teams chat into the pipeline	Nothing. Day/Transition/Evening crons handle BD 10:00–24:00 automatically. The BD 00:00–10:00 gap is unscheduled — if late-night chat needs to land before 10:00, run <code>scripts\push-chat.bat</code> manually.
Record a Teams call	Say a start phrase (“ Assalamualaikum ” / “ Start ” / “ Record start ”) when the call begins. Say a stop phrase (“ Allah Hafez ” / “ Stop ” / “ End call ”) when it ends. Recording only fires when Teams is actually in a call.
Include a file from Teams chat	Click Download on the attachment in Teams. The chat-push picks it up from <code>~/Downloads</code> on the next cron tick. Files that aren't downloaded leave only their URL on central — the LLM can't read their content.
Pull updates after a <code>git pull</code> notice	Double-click <code>scripts\update.bat</code>
Ad-hoc push of recent chat	Double-click <code>scripts\push-chat.bat</code> (pushes last 15 min)

Voice phrases

The daemon listens for any of these (case-insensitive):

- **Start recording** — “Assalamualaikum”, “Salaam alaikum”, “Nucleus start”, “Start recording”, “Record start”, “Call start”, “Start”, “Record”

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

- **Stop recording** — “Allah Hafez”, “Khoda Hafiz”, “Nucleus stop”, “Stop recording”, “End recording”, “Call end”, “End”, “Stop”

Recording only fires when MS Teams has an active call. Saying any phrase with Teams idle does nothing — by design. To edit phrases, open `data\teams\voice_phrases.json` and restart the daemon.

About chat attachments

The push captures chat messages plus any files that are downloaded locally and live in `~/Downloads` with a matching filename/size. **If a file matters for a requirement, click Download on it in Teams.** Otherwise the LLM sees only the filename and URL, not the content.

HELP

Troubleshooting

- **Scheduled task ran but no file on central** — verify Test-Path `\\172.16.205.209\nucleus-central`. If False, get on the VPN or ask Zaman for share access.
- **“no Teams session in Active state”** — the Teams-only gate working as designed. Teams must be ringing or in a call. Pass `--allow-any-call` to disable.
- **Recording captured your voice but not the other party's** — *Teams* → *Settings* → *Devices*, set Speaker to “Same as system / Default”. The separate Communications Device default makes WASAPI loopback miss the other party.
- **Teams chat ingest captures nothing even though you're chatting** — every chat must have been opened at least once in the desktop client so Teams writes its content to disk. Open each conversation once and let it load.

For anything else, ping **Zaman** with the exact error message and which step you were on.

UPGRADE

From the pre-2026-05 single-task setup

If `Get-ScheduledTask -TaskName 'NAPCO Nucleus*'` shows a plain `NAPCO Nucleus - Chat Push` (singular, no parens), you're on the pre-2026-05 single-task setup. Upgrade:

```
cd "E:\Projects\NAPCO-Nucleus" # replace with your actual clone path
git pull
Set-ExecutionPolicy -Scope Process -ExecutionPolicy Bypass
.\scripts\register-chat-push-task.ps1
```

NAPCO Nucleus

Team Onboarding | Setup Guide

Five steps to stream Teams chat, attachments, and calls into the central pipeline · 2026-05

The script unregisters the old Chat Push + Chat Push (Backfill) tasks and installs the new Day/Transition/Evening triple. Verify with the same Get - ScheduledTask command afterward — you should see exactly three tasks, all Ready.

NOTES

Three things to keep in mind

1

Drive folder for requirement files

Drop any client-supplied PDF, Word doc, audio recording, or plain text into this Google Drive folder. The agent host pulls everything in this folder during each run and extracts the text for requirement identification.

https://drive.google.com/drive/u/0/folders/1u7Y2I17VKRnyoBRTY97_W81Lt7Hp5PK3

2

Email destination for requirements

Any email forwarded to or addressed to `khasan@ael-bd.com` is automatically picked up by the system. Body text plus any PDF / Word / Excel / text attachments get extracted and fed into the requirement identifier.

3

Teams chat, attachments, and calls are auto-shipped

Once setup is complete, your MS Teams chats, the files you download from chat, and any calls you record (with the voice phrases) are **automatically sent to central** where requirement management runs. You don't have to manually export, copy, or forward anything — just keep Teams open and the voice daemon running.
